In addition to ensuring that price discovery processes are in place, these also provide a foundation for traditional diamond certification. It ensures that in the future, diamonds that are offered for sale have a pre-specified origin, meaning that they are of a standard that satisfies the stated grades, as well as having met all the relevant ethical standards and legal requirements. Currently, these processes are used by the diamond industry to verify the origin of diamonds. With this framework in place, stores of various kinds are able to make smart choices in their diamond buying. For instance, Mion Diamonds' Fairtrade Diamonds program is working towards making diamonds that are offered for sale for a cheaper price. The idea is to ensure that the income from diamond sales goes back to the growers. But why has the world of diamonds found this concept useful? The answer is simple. Different standards for grading diamonds are used to measure their quality. While the benefit of this has been well-documented for the industry, the grading system is also an important tool to ensure that the diamond value remains strong in the long run. In addition, it is of utmost importance that these standards are trusted and used for the rest of the industry as well. With diamond grading certification, all diamonds are measured against a set of standards. These standards are set by the GIA (Gemological Institute of America) along with the related DIF, or Diamond Identification Firm. These two organisations are the ones who set the global diamond standards and these are also used by every diamond retailer in the industry, since they use quality grades as a basis for choosing which diamonds to sell. The standards and systems for grading diamonds are set by the international industry to ensure that the diamond values and grades are as standard as possible, and that such standards are followed all over the globe. It is against these standards that diamonds are graded and passed, giving individuals a clear idea of how valuable the diamond is. In addition to the pre-determined grade, diamonds also have a certain GIA certification grade. However, this is only a general indication, since certain diamonds, such as diamonds in good and very good shape, could have the same certificate grade
